                                                                                                                                                                                                                                                                                                                                A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                       Reverse transcription primer used in cDNA analysis technique.
                                                                                                 04-AUG-1995

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.

The method can be used to analyse gene expression rapidly and easily

                                                                                                                                                                                                                                                                                                                                          A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type (labelled reverse transcription primers (cENESSRO files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                Reverse transcription primer used in cDNA analysis technique.

The method can be used to analyse gene expression rapidly and easily
A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ Eiles ANQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of
                                                                                                                                                                                                                       Analysis of cDNA and gene expression - by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 01-NOV-1994.

                                                                       Query Match
                                                                                                                      A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in sepera method can be used to analyse gene expression rapidly and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a Quiral type (labelled reverse transcription primers (GRNASEG files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                       Lysine; synthetic storage protein; SSP; vector; pSK6; dihydrodipicolinic acid synthase; corn; maize; Zea mays; Glycine max; transgenic plant; essential amino acid; ss.
                                                                                                                                                                 Synthetic.
                                                                                                                                                                                                                                              SSP7 Oligonucleotide SM 82.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.

They were annealed and used in the construction DNA fragments (see also AAQ94978-80, AAQ94992, AAQ95004 and AAQ95006) that were inserted into vector pSK6 (see also AAR78236). The DNA fragments code for synthetic storage proteins (SSPs) contg. multiple lysine-rich heptad repeats (see AAR78239-41, AAR78249, AAR78258 and AAR78260). These can be expressed in the seeds of transformed plants, e.g. soybean and corn, to improve lysine content

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          문
AAT36633 is a probe used to detect the glyceraldehyde phosphate dehydrogenase (GARDH) gene, which was used as a control in a PCR reaction for detection of human papilloma virus and cellular sequences. Detection of mRNA contg. HPV and cellular sequences comprises: (a) isolating mRNA from an processed body sample; (b) converting to cDNA by using a reverse transcription primer (RTP); (c) amplification of cDNA by PCR with an HPV converting to cDNA by PCR with an HPV converting a sequence of RTP; (d) cleaving amplified cDNA with an enzyme that cuts the 5' side of the HPV polyA signal; (e) amplification of uncleaved cDNA with the same primers as in converting to a signal; (e) amplification of uncleaved cDNA with the same primers as in signal; (e) are with nested primers; and (f) detecting amplified DNA. The method is used for early diagnosis of carcinoma and high-grade dysplasia caused by HPV. Step (d) cleaves cDNA derived from episomal HPV but not that derived from HPV that has integrated into the genome. The method is very sensitive and selective and can detect a very small no. of HPV-infected cells. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        primers on e.g. blood or sputum samples. The method is useful for screening and monitoring tumours and metastases, e.g. small cell lung, cervical, colonic, hepatic, brain, breast or screening accinomas. The present sequence is that of a probe which was used to detect amplified GAPDH sequences as a control in an experiment to amplify human papilloma virus HPV16 and HPV18 sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                              Primer oligo 4.1 (AAT35538) and primer oligo 4.2 (AAT35539) were designed using the known human DNase I mRNA sequence. They were used in the PCR amplification of human genomic DNA. A probe was generated and used to screen a human leukocyte DNA library. An isolated clone included a region (see also AAT35522) upstream of the known DNase I CDNA sequence, and a region (AAT35523) of the DNase I locus including exon 1, intron 1 and part of exon 2. Non-coding sequences of the DNase I locus can be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Altering expression of genes encoding thrombopoietin, DNase interferon - using DNA constructs useful in gene therapy to cystic fibrosis and multiple sclerosis.

The amplified sequence can be used in a recombinant virus used in the method of the invention. The method of the invention is for increasing ureagenesis by administration of a recombinant virus that expresses at least one enzyme of the urea cycle in vivo. The method is used to transmant of the urea cycle enzyme (e.g. early onset hyperammonaemia and associated encephalopathy) or non-specific liver failure characterised by inadequate ureagenesis, e.g. where caused by cirrhosis or cancer. The urea cycle enzyme may be, e.g., carbamoyl phosphate synthetase, ornithine transcarbamylase, argininosuccinate synthetase, argininosuccinate lyase or arginase. This method is an alternative to liver transplantation

```
recombinant vaccinia virus comprising of a gag gene from a retrovirus such as HIV-1 or HIV-2, fused to a DNA fragment containing an epitope region (30-300 bases in length) of a retroviral gene other than the gag gene. The gag gene may be altered so as to produce a gag protein modified from the natural sequence by the addition, deletion or substitution of at least 1 amino acid residue. The fusion gene is inserted into a region of a vaccinia virus not essential to its propagation, to give a recombinant vaccinia virus vector which is used to transform a host cell (such as HeLa, Vero, VEF, rabbit kidney RKI3 or human myeloma TK-143 cells). Upon culturing the host cell produces particulate structures containing the fusion gag protein. The recombinant vaccinia virus or the fusion gag protein particles may be used in the production of vaccines for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes Secale cereale microsatellite markers based on hypervariable genomic segments of Secale cereale and plants of the tribes Triticeae and Poeae. The microsatellite markers comprise a simple Sequence repeat (SSR) marker as sequence tag site (STS), defined by two specific S. cereale defined primers, of mean length 18-26 bases and Financian the microsatellite sequence (MSS). Such markers are useful for genetic analysis of rye, triticale and other species of the tribes Triticeae and Poeae, e.g. for DNA fingerprinting; identification of varieties; detecting self or cross fertilization; studying similarity and relatedness; characterization of cytological lines, or generally any sort of gene mapping. Particularly, they are useful for genetic mapping and marking of mono- or poly-genic traits, selection and evaluation of varietal purity or checking culture stages (particularly in hybrid culture methods), purity of propagative materials, success of self-fertilization and required ratio of components in populations and hybrids. AAX36902-X36965 represent PCR primers used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

```
recombinant protein, as a source of primers for amplification (to identify and isolate related sequences, e.g. alleleic variants) or probes for mucleic acid hybridisation tests for detecting S. pneumoniae, and in DNA vaccines. The encoded protein and its fragments can be used to raise antibodies, in vaccines and for detecting S. pneumoniae (by reaction with specific antibodies). Antibodies are useful in diagnostic immunoassays, to treat infections and to raise anti-idiotype antibodies for use in vaccines. This protein is very highly conserved between the different serotypes of S. pneumoniae so is an excellent candidate for vaccine development. (Updated on 20-MAR-2003 to correct PR field.)

Detection of tumor cells by nucleic acid amplification assay

Example; Col 3; 4pp; German

tumors, e.g. bronchial, mammary, colorectal, prostatic and C-cell carcinomas and other neuroendocrine differentiated tumors or their metastases. Very small numbers of tumor cells can be detected both in tissue samples and in body fluids. AAZ23525-Z23532 represent PCR prime This invention describes a novel method for the detection of tumor cells in a body sample which involves assaying for prepro gastrin-releasing peptide (preproGRP) mRNA. The method is used for the diagnosis of various prepro gastrin-releasing for the diagnosis of various

                                                                                                                                                                                                                                               This synthetic double-stranded oligonucleotide encodes a lysine-rich heptad repeat peptide. It can be inserted into the unique EarI site in the 'base gene' (see AAV99505) of vector pSK5 to provide repetitive heptad coding sequences. Chimeric genes for lysine-rich synthetic seed storage proteins suitable for expression in the seeds of plants have be constructed (see AAV99513-18, AAV99527-32, AAV99539-41). The invention provides methods for improving the nutritional quality of seeds from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids and chimeric genes for increasing seed lysine content - comprise sequence encoding all or part of lysine ketoglutarate reductase, useful to improve nutritional quality of seeds from transformed plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes novel microsatellite markers (MSM), based on the hypervariable genomic regions of rye (Secale cereale) and of plants from the tribes Triticeae and Poeae. MSM, which are new genetic markers for rye and closely related species, are used for genetic analysis and in breeding programs. Typical applications are in DNA fingerprinting; identification of varieties; detection of self and cross pollination; characterization of cytoplasmic lines, and genetic mapping (of mono- or poly-genic traits). MSM show a higher degree of polymorphism than known markers (both within and between different rye varieties and lines); can be detected by polymerase chain reaction, so that even very small samples may be analyzed, and generate many allelse per marker locus. AAZ23827-Z23886 represent the microsatellite marker PCR primers described in the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                           PCR primers AAZ10412-13 were used to amplify DNA encoding a pneumoccocal surface adhesion A protein (PBAA) The specification describes monoclona antibodies which bind epitopes of the PBAA protein (see AAX30351-54). These peptides can be used in vaccines to prevent Streptococcus pneumoniae infections. The antibodies of the invention can also be used
                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                26-FEB-1999;

```

progesterone suitable for transdermal delivery and maintaining the plasma concentration of natural progesterone above 10 ng/ml. The composition is applied topically for treating or preventing cancer in a patient whose plasma natural progesterone level is less than 10 ng/ml. The composition and method are useful for treating breast cancer by regulating the natural progesterone level in person's plasma. Prevention of cancer can also be secured. Progesterone application also exhibit protection or therapeutic activity in management of other forms of cancer. Sequences AAZ46804-805 represent control PCR primers for amplifying the human beta-

Novel biallelic markers used to construct a high density disequilibrium human genome

Claim 8; Page 2382; 2745pp; English.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   13-OCT-1999;
12-JAN-2000;
12-OCT-2000;
The invention relates to novel polypeptides, termed MBSPX and polynucleotides encoding the MBSPX polypeptides. The MBSPX polypeptide, nucleic acid and an MBSPX antibody are useful for treating or preventing a pathology associated with the protein especially in humans. The MBSPX nucleic acid can be used to express MBSPX protein (e.g. via a recombinant expression vector in a host cell in gene therapy applications), an to detect MBSPX mRNA in a biological sample or a genetic lesion in a MBSPX gene. Disorders associated with insufficient or excessive production of MBSPX protein include cancer, preclampsia, immune system disorders and inflammation, neurological disorders, cardiovascular disorders; and skin and muscle abnormalities. The anti-MBSPX antibodies can be used to detect and isolate MBSPX proteins and modulate MBSPX activity. Sequences ARP83018-023 represent gene specific PCR primers for amplifying the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MBSPX; cancer; preclampsia; immune system; neurological; cytostatic; gynecological; antiinflammatory; neuroprotective; inotropic; relaxan
                                                                                                                                                                                                                                                                                                                                                                                                                 Example

                                                                                                                                                       The invention relates to novel polypeptides, termed MBSPX and polymucleotides encoding the MBSPX polypeptides. The MBSPX polypeptide, nucleic acid and an MBSPX antibody are useful for treating or preventing a pathology associated with the protein especially in humans. The MBSPX nucleic acid can be used to express MBSPX protein (e.g. via a recombinant expression vector in a host cell in gene therapy applications), an to detect MBSPX mRNA in a biological sample or a genetic lesion in a MBSPX gene. Disorders associated with insufficient or excessive production of MBSPX protein include cancer, preclampsia, immune system disorders and inflammation, neurological disorders, cardiovascular disorders; and skin and muscle abnormalities. The anti-MBSPX antibodies can be used to detect and isolate MBSPX proteins and modulate MBSPX activity. Sequences AAF83018-023 represent gene specific PCR primers for amplifying the
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel human polynucleotide sequences and the membrane bound or secreted polypeptides encoded by these sequences, designated MBSPX.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     13-OCT-1999; 99US-0159231P.

                                                                                                                                                                                                                                                                                                                                     The sequence represents a PCR primer used for amplification of DNA encoding Streptococcus pneumoniae 37-kDa surface adhesin A protein. Infection by S. pneumoniae leads to pneumococcal disease. The 37-kDa surface adhesin A protein and its corresponding DNA can be used as a vaccine component for treatment and prevention of pneumococcal disease, as well as a reagent for identifying host antibodies raised against S. pneumoniae during infection. The protein may also be used as primers for amplifying nucleic acids from other strains of S. pneumoniae to isolate allelic variants of the protein, or for reverse transcription techniques, and as probes for the protein, or for reverse transcription techniques.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     37-kDa surface infection; ss;

                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thrombosmbolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification

The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myoccardial infarction, coronary heart disease, stroke, peripheral vascular disease, venous thrombosembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                             Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atheroscierosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thrombosembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                  Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, mycocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acids comprising single nucleotide polymorphisms, useful applications such as forensics, paternity testing, medicine, gene analysis and phenotype correlations to diseases such as diabetes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC an inflammatory immune disease. The method of the invention comprises
C reducing expression of a NURR subfamily nucleic acid sequence or
CC corticotropin releasing hormone (CRH) receptor nucleic acid sequence,
CC inhibiting transcriptional activity of a NURR superfamily member/CRH
CC receptor amino acid sequence, or reducing the level of NURR superfamily
CC member/CRH receptor sequence. The method is useful for treating an
CC organism for an inflammatory immune diseases such as chronic inflammatory
CC joint disease, preferably arthritis, selected from rheumatoid arthritis,
CC psoriatic arthritis and sarcoid arthritis, ulcerative colitis and
CC thyroiditis. The method is also useful for screening a compound that
CC interferes with interaction of a NURR subfamily polypeptide with a
CC ligand, or identifying a compound for the treatment of an inflammatory
CC immune response. The agonist of the invention is useful for inhibiting
CC transcriptional activity of nuclear receptor polypeptide and the
CC antagonist is useful for decreasing the expression of a NURR subfamily
CC member. The present nucleic acid sequence represents the human CRH
CRH-R1) sense PCR primer that was used in the
CC methods of the invention for amplification of human CRH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S
CC triple-helix forming oligonuclectides, having at least 3 sequencial CC purine and/or pyrimidine bases, capable of inhibiting transcription of CC ICAM-1. (A) has a sequence specific for the transcribed or promoter CC regions of the ICAM-1 (intracellular adhesion molecule) gene. The CC products of the invention have antipsoriatic, darmatological, CC antiasthmatic, antiinflammatory, immunosuppressive and gastrointestinal CC activity. (A) are used for treatment or prevention of ICAM-1-associated CC diseases, specifically psoriasis, neurodermatitis, allergic asthma, CC Crohn's disease, autoimmune diseases and transplant rejection. Compared CC with antisense oligonuclectides, (A) provide a longer-lasting effect CC (they bind directly to the gene, so a compensatory increase in CC transcription is not possible). (A) may be coupled to psoralen to provide light-regulatable, sequence-specific downregulation of genes; this should cake photo-ultra-violet therapy more specific, with reduced side effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Best Local Similarity Matches 17; Conserv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

MAP binds to monoclonal antibody obtained in response to immunising an animal with pneumococcal surface adhesion protein A (PsaA) or its fragment. MAP is useful for conferring protective immunity against S. pneumoniae infection in a subject. The present sequence is Streptococcus pneumoniae serotype 6B gene amplifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 21 BP; 5

The invention relates to an isolated nucleic acid from a human gene encoding aminopeptidase P (XPNED), bradykinin receptor B1 (BDKRB1), tachykinin receptor B1 (TACR1), C1 esterase inhibitor (C1MH), kallikrein 1 (KLK1), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme 2 (ACE2) or protease inhibitor 4 (P14), comprising at least one polymorphic position. Also included are (1) a probe that hybridises to a polymorphic position as provided in the detailed summary of single nucleotide polymorphisms comprising additional 5' and 3' flanking genomic
                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid with at least one polymorphic position, useful for detecting, diagnosing and treating disorders such as angioedema, cancer, viral, bacterial or fungal infection, cardiovascular and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             04-DEC-2000; 2000US-0251015P

nucleic acid sequence at one or more polymorphic positions in a gene encoding a protein selected from the group above; (3) constructing (M2) chaplotypes using the genes comprising grouping at least two nucleic acids ; (4) identifying (M3) an individual at risk of developing a disorder upon administration of an ACE inhibitor and/or vasopeptidase inhibitor comprises one or more polymorphic positions within a gene encoding a disorder luminan protein selected from the group above; and (6) genotyping (M4) an individual comprising obtaining a nucleic acid sample, determining the nucleotide present in at least one polymorphic position, and comparing at least one position with a known data set. The genes, (M1, M2, M3 and M4) and compositions are useful for detecting, diagnosing, treating, arratious disorders such as angioedaema and diseases which involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's disease, trachomas, and cardiovascular diseases like angina pectoris, hypertrophy, vascular diseases, aneurysm, embolism, thrombosis, coronary artery disease, arteriosclerosis, and intermune diseases inflammatory hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic obstructive pulmonary disease (COPD) and enterocollitis (many other diseases and disorders are listed in the specification). The polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is included in the sequence listing but is not referred to anywhere else in the specification analysing (M1) a sample from one (M1) at least one nucleic acid sample comprising om one or more individuals and determining the

CC polymorphic position. Also included are (1) a probe that hybridises to a CC polymorphic position as provided in the detailed summary of single CC nucleotide polymorphisms comprising additional 5' and 3' flanking genomic CC sequence; (2) analysing (M1) at least one nucleic acid sample comprising obtaining the sample from one or more individuals and determining the CC nucleic acid sequence at one or more polymorphic positions in a gene CC enciding a protein selected from the group above; (3) constructing (M2) for (4) identifying (M3) an individual at risk of developing a disorder CC using the polymorphic data; (5) a library of nucleic acids each of which comprises one or more polymorphic positions within a gene encoding a human protein selected from the group above; and (6) genotyping (M4) an CC individual at risk of developing a disorder CC using the polymorphic data; (5) a library of nucleic acids, each of which comprises one or more polymorphic positions within a gene encoding a cC human protein selected from the group above; and (6) genotyping (M4) an CC individual comprising obtaining a nucleic acid sample, determining the CC nucleotide present in at least one polymorphic position, and comparing at least one position with a known data set. The genes, (M1, M2, M3 and M4) and CC protein grant and selecters such as angioedaema and diseases which CC involve angiogenesis like haemangionas, tumours, sarcomas, Crohn's (hypertension, heart failure, myocardial infarction, ventricular CC hypertrophy, vascular diseases, aneurysm, embolism, thrombosis, coronary artery disease, arteriosclerosis and/or atherosclerosis, and coronary artery disease, arteriosclerosis and/or atherosclerosis, inflammatory The invention relates to an isolated nucleic acid from a human gene encoding aminopeptidase P (XPNEP2), bradykinin receptor B1 (BDKRB1) tachykinin receptor B1 (TACR1), Cl esterase inhibitor (ClNH), kalli 1 (KLK1), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme 2 (ACB2) or protease inhibitor 4 (PI4), comprising at least one kallikrein

                                                         plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis, ABIA2957 to ABIA5322 represent PCR primers for human chromosome 1p36-35 DNA, and ABIA5323 to ABIA5634 represent PCR primers for human chromosome 21q22.1, which are
                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed the maximum in the specified discrimination Nos, to array the multiwell the maximum in the specified discrimination Nos, to array the multiwell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           obstructive pulmonary disease (COPD) and enterocolitis (many other diseases and disorders are listed in the specification). The polynucleotides are also useful for them specification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is included in the sequence listing but is not referred to anywhere else in the specification

                                                                                                                                                         Query Match
                                                                                                                                                                                                                                                                               The invention relates to a kit for diagnosis and monitoring treatment, of testicular tumours comprising a pair of oligonucleotide primers (ABN85563 - ABN85572), each suitable for PCR amplification of one of the complementary strands of a DNA test sequence that encodes one of four marker proteins, i.e. alpha-fetoprotein (APP); the beta-subunit of human chorionic gonadotropin (bHCG) placenta-specific and/or germ cell-specific alkaline phosphatase (PLAP/GCAP). The kit is used for diagnosis and monitoring treatment of testicular tumours. The method detects marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 primers for amplifying specific of metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 21 BP; 7 A; 5 C; 6 G; 3 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                  For directionally assemblinant viral genome, particularly coronavirus, the method is useful for manipulating the genomes of higher plants and animals, as well as bacteria and viruses. In particular, the method is useful for the precise genetic manipulation of individual chromosomes in whole plants and animals and the construction of individual chromosomes for gene therapy. The genomes produced are useful in preparing vaccines and expression vectors (e.g., TGE vectors and vaccines), which are useful in protocols involving vaccination, gene transfer and gene therapy. This sequence represents the forward RT-PCR primer AAS21195 to amplify across the C/DE junction of the recombinant transmissible gastroenteritis (TGE) genome, described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes a method of directionally assembling a recombinant viral genome comprising ligating the subclones of the viral genome to assemble a recombinant viral genome, particularly coronavirus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Directionally assembling a recombinant viral genome, useful for manipulating the genomes of plants, animals, bacteria or viruses for therapy, by ligating the subclones of the viral genome to assemble recombinant viral genome.

Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.

Example 18; Page 134; 714pp; English

CC cryconnome Pass (LTP30V2AL), auteneys acceptor nuclear translocator (CC aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator (C ARNT), cathapsin S (CTSS), cyclooxgenase 2 (COX2), diazepam binding CC inhibitor (DBJ), epoxide hydroxylase 2 (EEHX2), 5-lipoxygenase activating CC protein (FLAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl CC transferase (NNMT), NADPH quinone oxidoreductase 2 (NQO2), CC transferase (NNMT), NADPH quinone oxidoreductase 2 (NQO2), CC (UGT2B4), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl (MRP2), actobransferrin (LTP), multidrug resistance associated protein 3 (C (MRP3), orphan nuclear receptor (NR112), or acetylcholine muscarinic cresponsible, lore specific (EMR1, CHMR2, CHMR3, CHMR4 or CHMR3) sequence. CC The polymorphisms in the human genes cited in the invention are useful as genetic linkage markers for locating and characterising the genes that CC are responsible for specific traits within the genome and eventually citentifying the genes responsible for a variety of disorder-related CC traits as a result of their e.g., overaypression, constitutive and/or treating the disorders. The nucleic acid molecules comprising the polymorphic sequences contained in CYP4501A1, CYP4501A2, CYP4501A2, CYP4501A3, CTPA4501A3, CTPA4501A3, CTPA4501A3, CTPA4501A3, AHR, MDR1 and/or MDR3 are useful for screening individuals for altered drug cusceptibility to colorectal tumours, in DBI or CHMR1 for altered central cc immunological or haematological function, in FLAP and HUM2 for altered serine cc immunological function, in CHMR3, CHMR4 or CHMR5 for altered central and haematological function, in CHMR3 or CHMR5 for altered central and haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and This invention relates to the sequence of an isolated nucleic acid molecule comprising at least one base variation from that of a known human cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A2), cytochrome P450 02E1 (CYP45002E1), adrenergic receptor betal (ADBR1).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SSXS
                                                                                   The invention relates to an isolated or substantially pure Von Willebrand CC factor-cleaving protease (VWF-cp) polypeptide. VWF-cp is useful for curifying vWF which involves providing vWF-cp as a ligand, contacting a cC solution comprising vWF with the polypeptide ligand under conditions compared to the ligand and recovering from the ligand purified CC vWF. vWF-cp is useful for producing anti-vWF-cp and isolating the anti-cc vWF-cp is useful for producing anti-vWF-cp and isolating the anti-cc vWF-cp polypeptide antibodies from the animal vWF-cp is useful for CC vWF-cp polypeptide antibodies from the animal vWF-cp is useful for CC vWF-cp polypeptide antibodies from the animal vWF-cp is useful for CC polypeptide antibodies from the animal vWF-cp is useful for CC producing a preparation of prophylaxis and therapy of thrombosis and CC thromboembolic disease such as thrombocytic purpura (TTP), CC Henoch-Schonlein purpura, preeclampsia, neonatal thrombocytopaenia or CC hemolytic-uraemic syndrome. vWF-cp can also be used for processing CC plasmatic or recombinantly produced vWF. The invention is useful for CC construction expression systems and generating transgenic animals which crepresses the polypeptide in vivon the present sequence is human vWF-cp pre-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

The invention relates to an isolated cytoplasmic, nuclear, membrane bound or secreted polypeptide, designated NOVX (actually NOV1, 2a, 2b, 3a, 3b, 3c, 5b, 5c, 5d, 5e, 5f, 5g, 5h, 5i, 6, 7 and 8), a variant of NOVX, a complement of NOVX. Also included are a complement of NOVX. Also included and the antibody. Complement of NOVX antibody are cardiomypathy, atherosclerous, haemophilia, complement of NOVX. Also included and the antibody are useful in screening assays, detection complement of NOVX. Also included and paper of NOVX disease, behavioural disorders, pain, complement of NOVX. Also included and paper of NOVX and in methods of treatment (e.g., diagnostic assays, prognostic assays, detection in a novx gene, and to modulate NOVX. The polynucleotide is cuseful in gene therapy, to express NOVX, to detect NOVX manh or a genetic lesion in a NOVX gene, and to modulate NOVX activity. The vector is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                25-AUG-2000; 2000US-0227800P.

                                                                                  The sequences given in ABA00315-17 are primers which were used to detect the presence of clonally expand CD4+CD28(null) T cells in unstable plaques. Sequences like these, may be used in the method of the invention for determining if a mammal has an unstable plaque. The method comprises determining whether or not a sample from the mammal contains an elevated level of a polypeptide which is encoded by a DNA responsive to an interferon-gamma-activated transcription factor. The level indicates that the mammal contains the unstable plaque. The method is useful in evaluating the severity of cardiovascular conditions, such as angina, specifically by determining whether a person has an unstable plaque. The method may also be used to identify compounds that are useful in treating or reducing the risk of developing life- threatening cardiovascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       useful for producing non-human transgenic animals. The antibody is to for isolating, and purifying NOVX and to monitor protein levels in tas part of a clinical testing procedure. The present sequence is an (reverse transcriptase)-PCR primer used to quantitate mRNA encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Determining whether or not a mammal has an unstable plaque, useful evaluating the severity of cardiovascular conditions, e.g. angina, comprises determining the level of CD64 or IP-10 polypeptide encode DNA responsive to STAT-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Transcription factor; STAT-1; monocyte; stable angina; SA; SIE oligonucleotide; interferon; IFY-gamma; unstable plaque;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ABA00315 standard; DNA; 21 BP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               맑
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a plant comprising two foreign nucleotide sequences which cause seeds obtained from the plant to accumulate lysine at a level of at least 10% higher than seeds of a plant that do not comprise the nucleotide, where the nucleotide comprises a fragment encoding a dihydrodipicolinic acid synthase (DHDPS) that is insensitive to lysine inhibition, and a fragment encoding a plant lysine ketoglutarate reductase (LKR) or its subfragment. The nucleotide fragment is operably linked to a plant chloroplast transit sequence (CTS) and the plant lysine ketoglutarate reductase subfragment is used in antisense this internal control of the plant that it is operably linked to a plant chloroplast transit sequence (CTS) and the plant lysine ketoglutarate reductase subfragment is used in antisense this internal control of the plant lysine ketoglutarate reductase subfragment is used in antisense that it is the control of the plant lysine ketoglutarate reductase subfragment is used in antisense that it is the plant lysine ketoglutarate reductase subfragment is used in antisense that it is the plant lysine ketoglutarate reductase subfragment is used in antisense that it is the plant lysine ketoglutarate reductase that it is the plant lysine ketoglutarate reductase that it is the plant lysine ketoglutarate reductase that the plant lysine ketoglutarate reductase that it is the plant lysine ketoglutarate reductase that lysine ketoglutarate reductase that lysine the plant lysine ketoglutarate reductase that lysine the plant lysine the plant lysine that lysine the plant lysine that lysine the plant lysine the plant
                                                                                                                         inhibition or cosuppression. Also included are progeny plants from the above mentioned plant and seeds obtained from the above mentioned plant. The seeds obtained from the above mentioned plant (e.g., rapseed, soybean or corn) comprising the foreign nucleic acid sequences accumulate lysine at a higher level, preferably at a level of at least 10% higher than seeds of a plant that do not comprise the foreign nucleic acid sequences. Chimaeric gene comprising DHDPS from C. glutamicum and sequences. Chimaeric gene comprising DHDPS from C. glutamicum and aspartokinase III (from the lysC gene) of E. coli (mutated to be lysine-insensitive) are also used to generate the above transgenic plants. Also disclosed are synthetic seed storage proteins (SSP) used as an internal source of lysine, built up from synthetic peptide monomers based around an Earl site sequence (for generating mutlimeric proteins). The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Transformed plants that accumulate lysine at higher levels in its seeds than untransformed plants, has gene fragments encoding lysine-insensitive dihydrodipicolinic acid synthase and lysine ketoglutarate reductase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             24-MAR-1997;
